3RB30, 3RB31 up to 80 A for standard applications

Overview

- (1) Switch position indicator and TEST function of the wiring: Indicates a trip and enables the wiring test.
- Trip class setting/internal ground-fault detection (only 3RB31): Using the rotary switch you can set the required trip class and activate the internal ground-fault detection dependent on the (2) start-up conditions
- 3 Solid-state test (device test): Enables a test of all important device components and functions.
- Connecting terminals (removable joint block for auxiliary circuits): Depending on the device version, the terminals for screw and (4)spring-type connection are configured for the main and auxiliary circuit.
- 5 Selector switch for manual/automatic RESET: With the slide switch you can choose between manual and automatic
- RESET.
- 6 Motor current setting: Setting the device to the rated motor current is easy with the large rotary knob.
- A device set to manual RESET can be reset locally by pressing the RESET button. On 3RB31 overload relays an electrical remote RESET is integrated. (7)
- (8) Connection for mounting onto contactors: Optimally adapted in electrical, mechanical and design terms to the contactors 3RT2. The overload relay can be connected directly using these connection pins. Stand-alone installation is possible as an alternative (in conjunction with a terminal support for stand-alone installation).

A sealable transparent cover can be optionally mounted (accessory). It secures the motor current setting against adjustment.

SIRIUS 3RU3133-4.B0 electronic overload relay

The 3RB30/3RB31 electronic overload relays up to 80 A with internal power supply have been designed for inverse-time delayed protection of loads with normal and heavy starting (for "Function", see the manual

SIRIUS Innovations - SIRIUS 3RU2/3RB3 Overload Relays" http://support.automation.siemens.com/WW/view/en/60298164) against excessive temperature rises due to overload, phase unbalance or phase failure. An overload, phase unbalance or phase failure result in an increase of the motor current beyond the set rated motor current. This current rise is detected by the current transformers integrated into the devices and evaluated by corresponding solid-state circuits which then output a pulse to the auxiliary contacts. The auxiliary contacts then switch off the load by means of a contactor. The break time depends on the ratio between the tripping current and current setting $I_{\rm e}$ and is stored in the form of a long-term stable tripping characteristic (see "Characteristic Curves

http://support.automation.siemens.com/WW/view/en/34290881/134300).

In addition to inverse-time delayed protection of loads against excessive temperature rises due to overload, phase unbalance and phase failure, the 3RB31 electronic overload relays also allow internal ground-fault detection (not possible in conjunction with contactor assemblies for wye-delta starting). This provides protection of loads against high-resistance short circuits due to damage to the insulation material, moisture, condensed water etc.

The "tripped" status is signaled by means of a switch position indicator. Resetting takes place either manually or automatically after the recovery time has elapsed ("Function", see manual "SIRIUS Innovations – SIRIUS 3RU2/3RB3 Overload Relays" http://support.automation.siemens.com/WW/view/en/60298164).

The 3RB3 electronic overload relays are suitable for operation with frequency converters. Please follow the instructions in the manual "SIRIUS Innovations - 3RU2/3RB3 Overload Relays", see http://support.automation.siemens.com/WW/view/en/60298164.

The devices are manufactured in accordance with environmental guidelines and contain environmentally friendly and reusable materials. They comply with all important worldwide standards and approvals.

3RB20 and 3RB21 overload relays in sizes S2 to S10/S12, see page 7/130 onwards.

Use in hazardous areas

The 3RB30/3RB31 electronic overload relays are suitable for the overload protection of motors with the following types of protection:

- 🔂 II (2) G [Ex e] [Ex d] [Ex px]
- 🐼 II (2) D [Ex t] [Ex p]

EC type test certificate for Group II, Category (2) G/D exists. It has the number PTB 09 ATEX 3001.

Benefits

The most important features and benefits of the 3RB30/3RB31 electronic overload relays are listed in the overview table (see "General Data" on page 7/87).

Advantages through energy efficiency

Overview of the energy management process

Application

Industries

The 3RB30/3RB31 electronic overload relays are suitable for customers from all industries who want to guarantee optimum inverse-time delayed protection of their electrical loads (e.g. motors) under normal and heavy starting conditions (CLASS 5E to 30E), minimize project completion times, inventories and energy consumption, and optimize plant availability and maintenance management.

Application

The 3RB30/3RB31 electronic overload relays have been designed for the protection of three-phase motors in sinusoidal 50/60 Hz voltage networks. The relays are not suitable for the protection of single-phase AC or DC loads.

catalog in the Selection and ordering data.

We offer you a unique portfolio for industrial energy management, using an energy management system that helps to optimally define your energy needs. We split up our industrial energy management into three phases – identify, evaluate and realize – and we support you with the appropriate hardware and software solutions in every process phase.

The innovative products of the SIRIUS industrial controls portfolio can also make a substantial contribution to a plant's energy efficiency (see www.siemens.com/sirius/energysaving).

3RB30/3RB31 electronic overload relays contribute to energy efficiency throughout the plant as follows:

- Reduced inherent power loss
- · Less heating of the control cabinet
- Smaller control cabinet air conditioners can be used

The 3RU21 thermal overload relay or the 3RB22/3RB23 solid-state overload relay can be used for single-phase AC loads. For DC loads we recommend the 3RU21 thermal overload relay.

Ambient conditions

The devices are insensitive to external influences such as shocks, corrosive ambient conditions, ageing and temperature fluctuations.

For the temperature range from -25 °C to +60 °C, the 3RB30/3RB31 electronic overload relays compensate the temperature in accordance with IEC 60947-4-1.

3RB30, 3RB31 up to 80 A for standard applications

Technical specifications

Connection type		Spring-type ter	ninals	
Operating devices	mm	3.0 x 0.5		
Conductor cross-sections (min./max.), 1 or 2 conductors can be connected				
Solid or stranded	mm ²	2 × (0.25 1.5)		
 Finely stranded without end sleeve 	mm ²	2 × (0.25 1.5)		
 Finely stranded with end sleeve (DIN 46228-1) 	mm ²	2 × (0.25 1.5)		
AWG cables, solid or stranded	AWG	2 × (24 16)		
 If two different conductor cross-sections are connected to one clamping point, both cross-sections must be in the range specified. 				

3RB30, 3RB31 up to 80 A for standard applications

3RB31 electronic overload relays, CLASS 5E, 10E, 20E or 30E (adjustable)

Features and technical specifications:

- Connection methods
 - Sizes S00 and S0: Main and auxiliary circuit: Either screw or spring-type terminals
 - Size S2:
 - Main circuit: Screw terminals with box terminal or as straightthrough transformer, auxiliary circuit: Either screw or spring-type terminals
- Overload protection, phase failure protection and unbalance protection
- Internal ground-fault detection (activatable)
- Internal power supply

- Auxiliary contacts 1 NO + 1 NC
- · Manual and automatic RESET
- Electrical remote RESET integrated
- · Switch position indicator
- TEST function and self-monitoring
- Sealable covers (optional accessory)
